

Type MV Directional Spray Nozzles, Open Medium Velocity

IMPORTANT

Refer to Technical Data Sheet TFP2300 for warnings pertaining to regulatory and health information.

Always refer to Technical Data Sheet TFP700 for the "INSTALLER WARNING" that provides cautions with respect to handling and installation of sprinkler systems and components. Improper handling and installation can permanently damage a sprinkler system or its components and cause the sprinkler to fail to operate in a fire situation or cause it to operate prematurely.

General Description

The TYCO Type MV Nozzles are open (non-automatic) directional spray nozzles designed for use in water spray fixed systems for fire protection applications. They are external deflector-type nozzles that discharge a uniformly filled cone of medium velocity water droplets.

The Type MV Nozzles are effective in covering exposed vertical, horizontal, curved, and irregular shaped surfaces in a cooling spray to prevent excessive absorption of heat from an external fire and possible structural damage or spread of fire to the protected equip-

ment. In some applications, depending on water design density requirements, the Type MV Nozzles may also be used for fire control or extinguishment.

The Type MV Nozzles are available in a wide variety of orifice sizes and spray angles (included angle of discharge) to provide versatility in system design.

The Type MV Nozzles having orifice diameters smaller than 9,5 mm (0.37 in.) are factory assembled with an orifice insert and strainer. Strainers have 3,2 mm (1/8 in.) diameter holes. Nozzles equipped with strainers range in size from MV10 to MV30 (Ref. Table A).

It is recommended that the end user be consulted with respect to the suitability of the materials of construction and finish for any given corrosive environment. The effects of ambient temperature, concentration of chemicals, and gas/chemical velocity, should be considered, at a minimum, along with the corrosive nature to which the Type MV Nozzles may be exposed.

NOTICE

The TYCO Type MV Nozzles described herein must be installed and maintained in compliance with this document and with the applicable standards of the NATIONAL FIRE PROTECTION ASSOCIATION (NFPA), in addition to the standards of any authorities having jurisdiction. Failure to do so may impair the performance of these devices.

The design of individual water spray fixed systems can vary considerably, depending on the characteristics and nature of the hazard, the basic purpose of the spraying system, the configuration of the hazard, and wind/draft conditions. Because of these variations, as well as the wide range of available nozzle spray characteristics, the design of water spray fixed systems for fire protection must only be performed by experienced designers who thoroughly understand the limitations as well as capabilities of such systems.

The owner is responsible for maintaining their fire protection system and devices in proper operating condition. Contact the installing contractor or product manufacturer with any questions.

NOTES:

1. Design data obtained from tests in still air.
2. Design data applies to a residual (flowing) pressure range at the nozzle inlet of 1,4 to 4,1 bar (20 to 60 psi). For pressures up to 12,1 bar (175 psi) consult Tyco Fire Protection Products Technical Services.
Refer to the authority having jurisdiction for their minimum required residual pressures.
3. The shapes of the Design Spray Profiles remain essentially unchanged over the maximum Axial Distances shown in Tables E and F.
4. For axial distances of 0,6 meters (2 feet) and less and for nozzle spray angles of 90° to 140°, the Design Spray Profile is the same as the nominal spray angle.
5. The maximum Axial Distances shown in Tables C and D are based on exposure protection.

FIGURE 2
WATER DISTRIBUTION DESIGN DATA

Design Criteria

Nozzle Placement

Where direct impingement of water spray onto all of the protected surface is required by the authority having jurisdiction, TYCO Type MV Nozzles are to be spaced and directed so that their spray patterns will completely cover the plane-of-protection with the minimum required average density. However, it is recommended that indoor nozzle spacing be 3,7 m (12 ft) or less and that outdoor nozzle spacing be 3,0 m (10 ft) or less. Where rundown or slippage is planned, for example, exposure protection of vessels per NFPA 15, the above recommended indoor and outdoor spacings also apply.

When used for protecting the surfaces of a vessel, for example, MV nozzles are positioned normal to and approximately 0,6 m (2 ft) from the surface. This approach, in conjunction with a properly selected spray angle, will tend to make more effective use of the spray as well as help minimize the disturbance effects of wind/draft conditions on the water spray patterns.

Spray Patterns

The Design Spray Profiles for MV nozzle spray angles of 90 to 160 degrees are shown in Graphs A through M and apply to discharge pressures of 1,4 to 4,1 bar (20 to 60 psi). Discharge pressures in excess of 4,1 bar (60 psi) will result in a decrease in coverage area since the spray patterns tend to draw inwards at higher pressures. The maximum axial distances between the nozzle tip and plane-of-protection, for exposure protection, are given in Table C and D.

When the axial distance from the nozzle tip to the plane-of-protection is 0,6 m (3 ft) or less, the Design Spray Profile is the same as the nominal spray angles of 90 to 140 degrees.

Main Pipeline Strainers

Main pipeline strainers per NFPA 15 are required for systems utilizing nozzles with a flow path less than 9,5 mm (0,37 in.) diameter, that is, from MV10 to MV30 (Ref. Table A), and for any system where the water is likely to contain obstructive material.

Installation

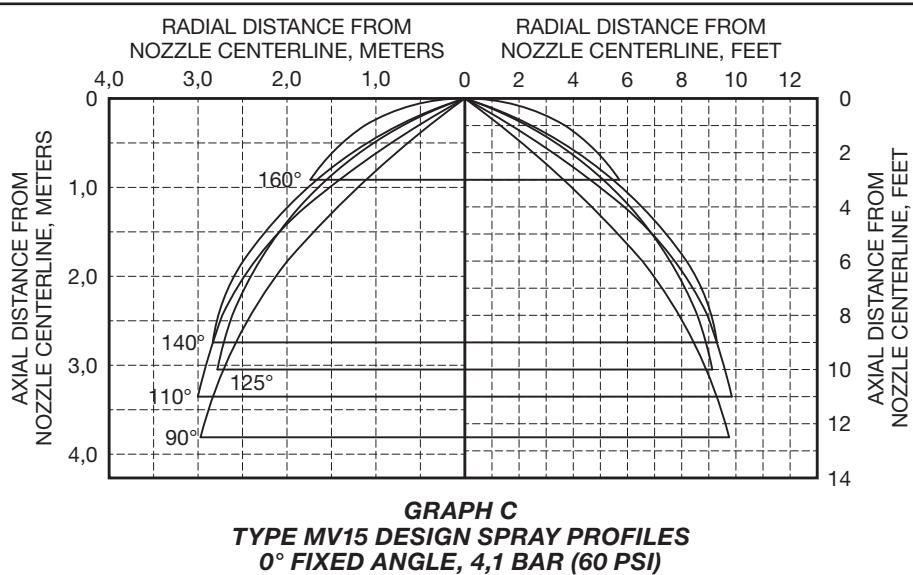

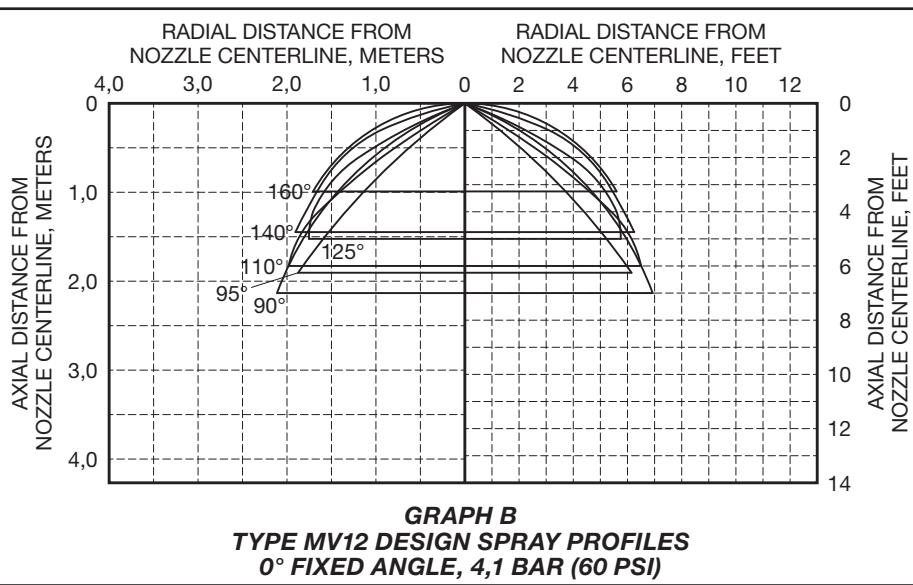

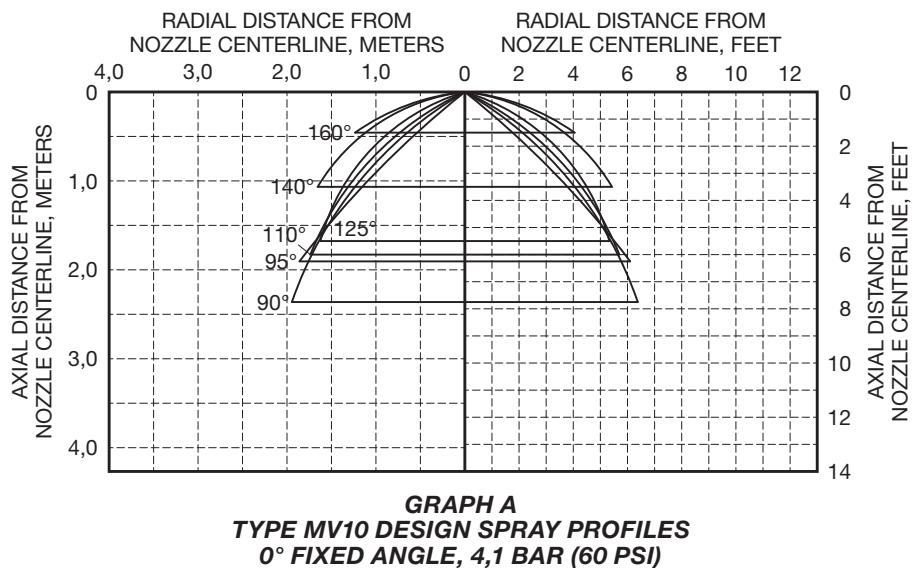

The TYCO Type MV Nozzles must be installed in accordance with this section.

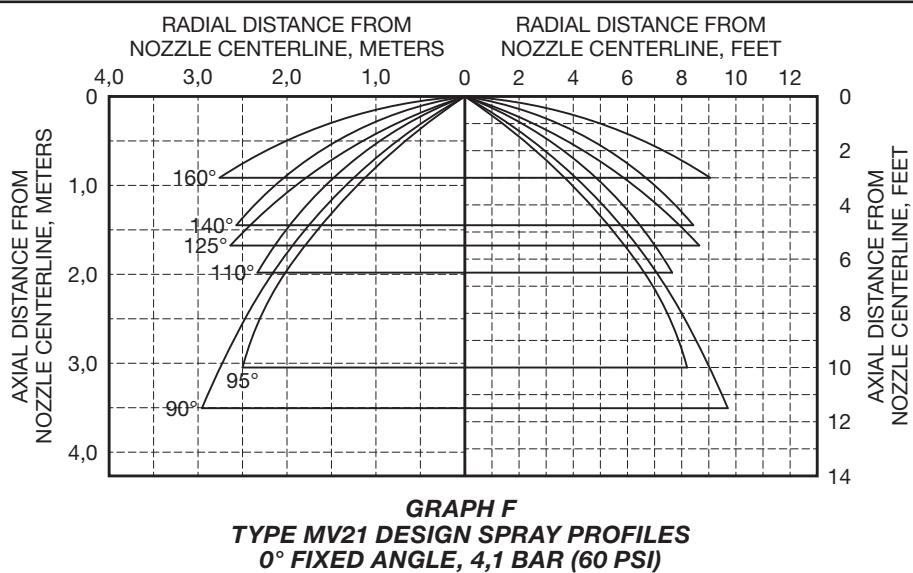

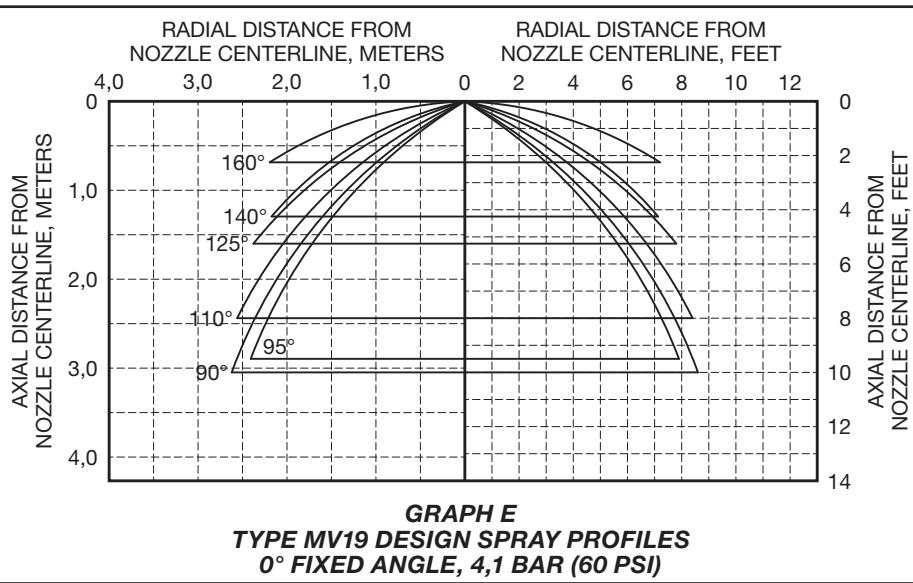

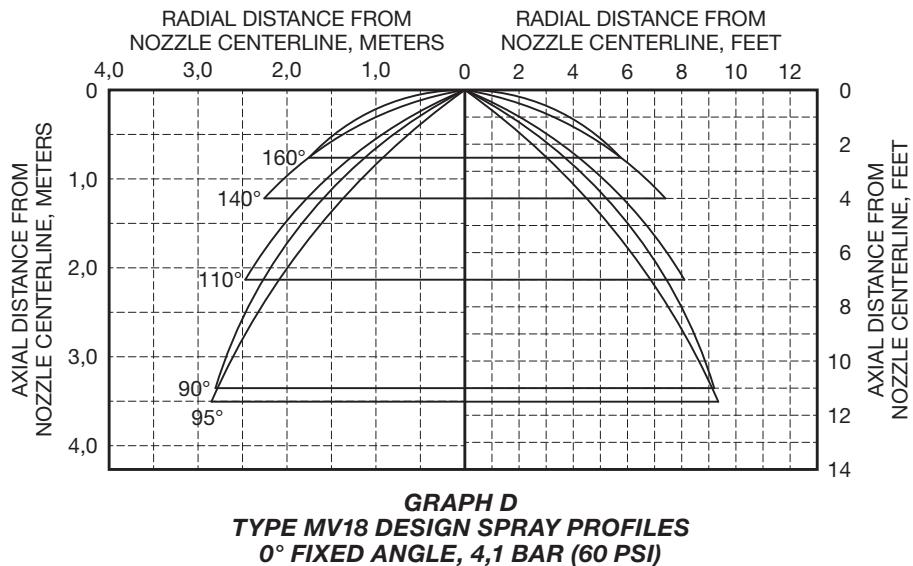

General Instructions

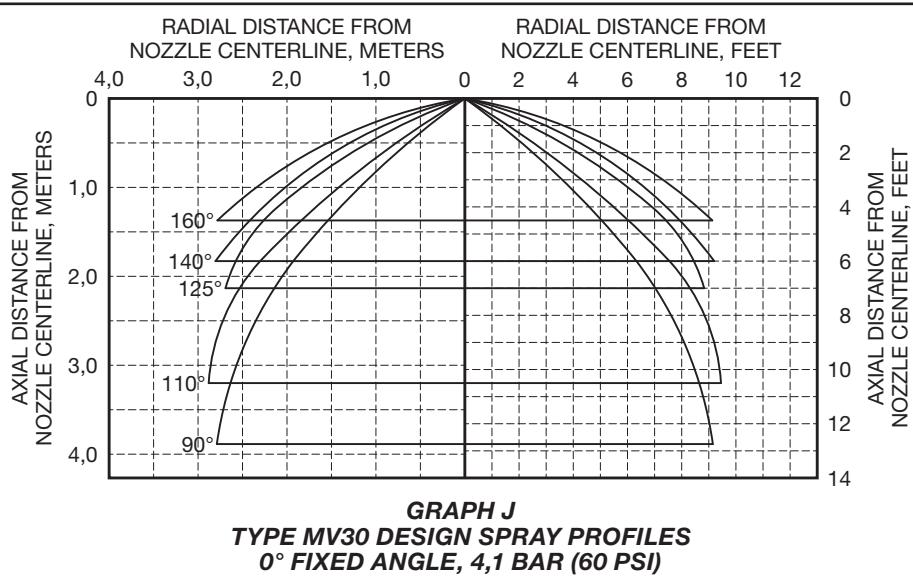

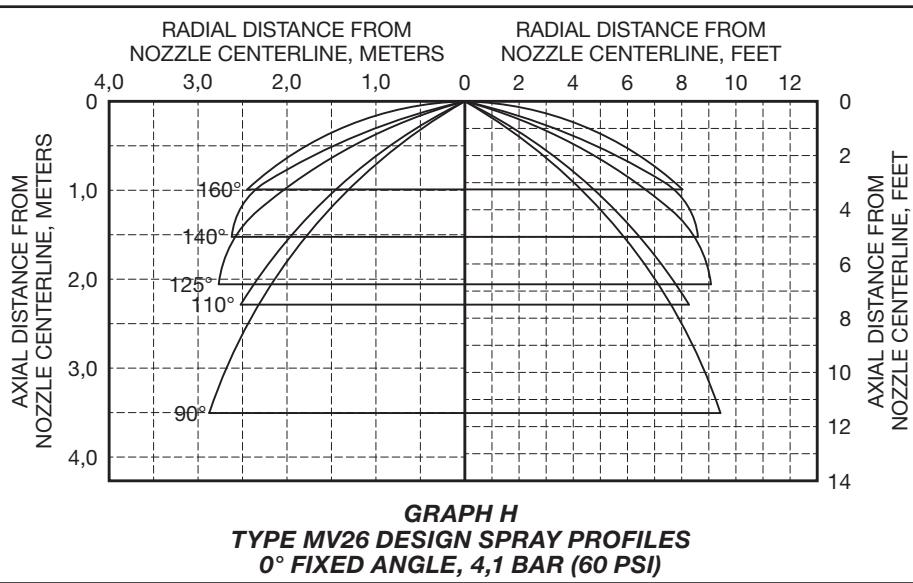

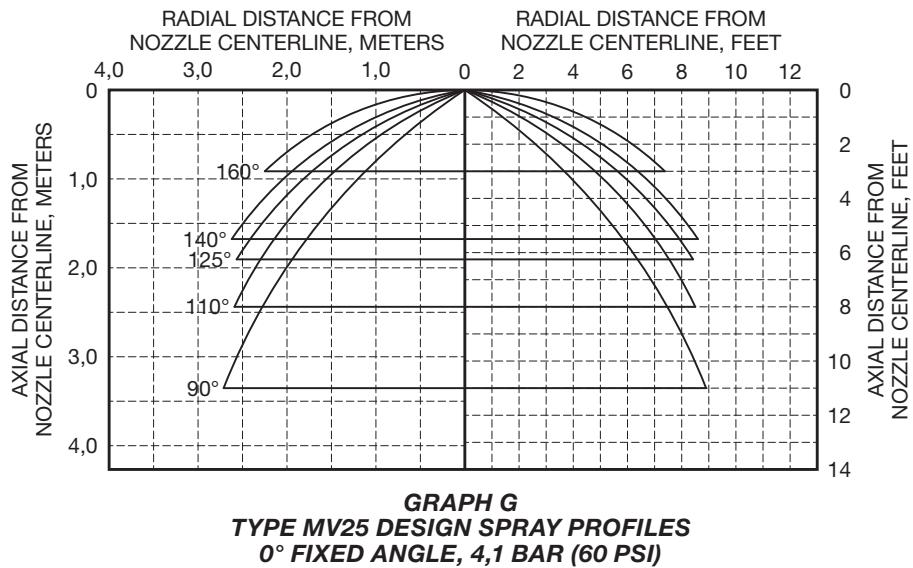

A leak-tight 1/2 in. NPT sprinkler joint should be obtained by applying a minimum-to-maximum torque of 9,5 to 19,0 N·m (7 to 14 ft-lb). Higher levels of torque can distort the nozzle Inlet with consequent impairment of the nozzle.

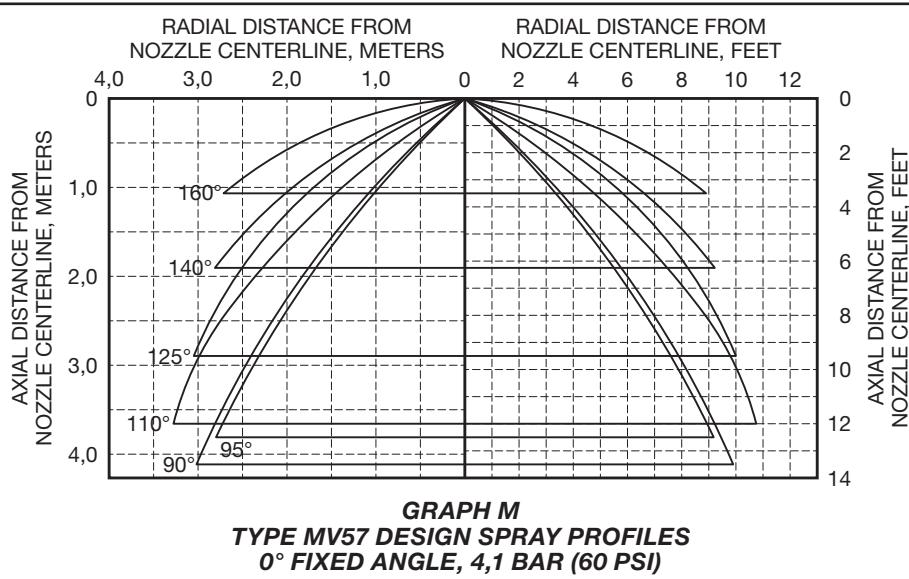

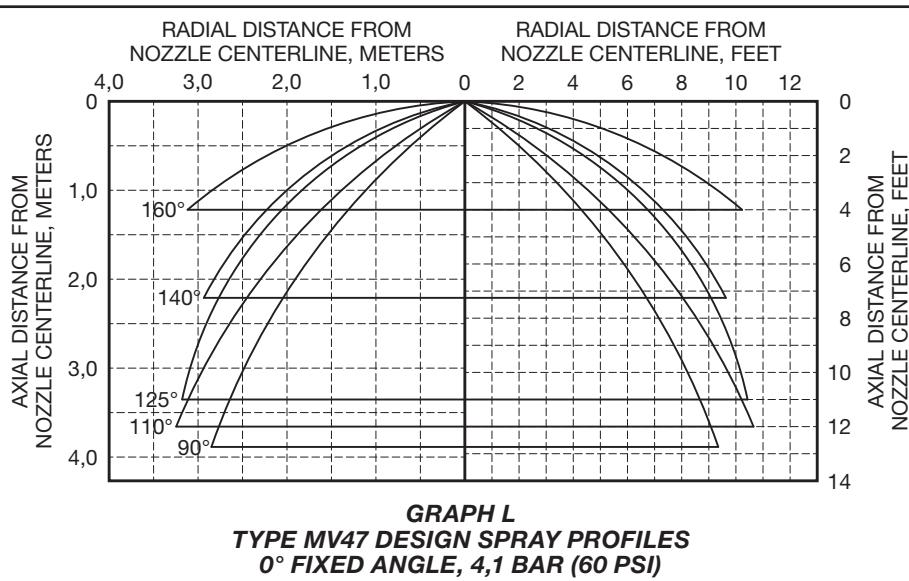

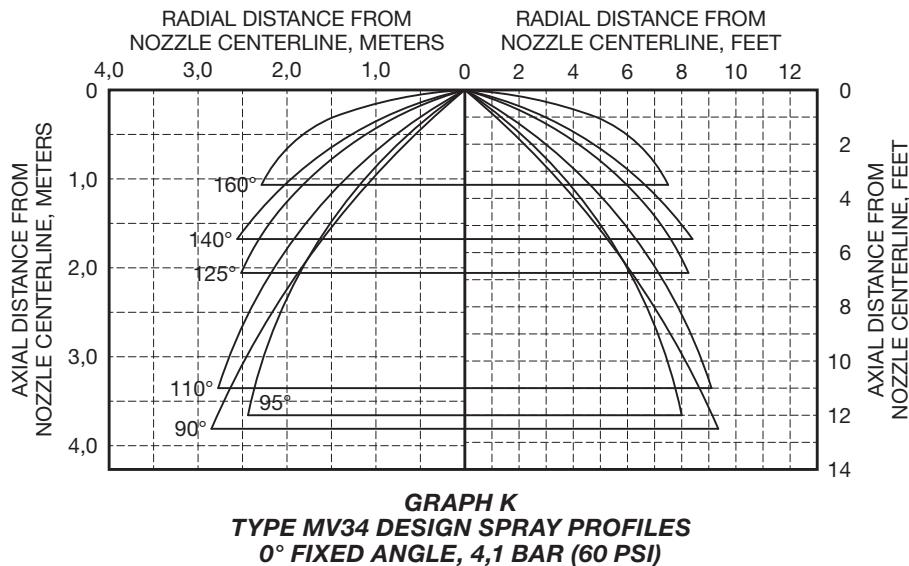

Step 1. With pipe-thread sealant applied to the pipe threads, hand-tighten the nozzle into the nozzle fitting.

Step 2. With reference to Figure 1, apply an appropriate size adjustable Crescent wrench to the wrenching area and tighten the nozzle into the nozzle fitting.

Care and Maintenance

The Tyco Type MV Nozzles must be maintained and serviced in accordance with this section.

Before closing a fire protection system main control valve for maintenance work on the fire protection system that it controls, obtain permission to shut down the affected fire protection system from the proper authorities and notify all personnel who may be affected by this action.

Type MV Nozzles must never be painted, plated, coated or altered in any way after leaving the factory; otherwise, the spray performance may be impaired.

Exercise care to avoid damage to the nozzles, before, during, and after installation. Replace nozzles damaged by dropping, striking, wrench twist/slippage, or the like.

Frequent visual inspections are recommended to be initially performed for nozzles installed in potentially corrosive atmospheres to verify the integrity of the materials of construction and finish as they may be affected by the corrosive conditions present for a given installation. Thereafter, annual inspections per NFPA 25 are required.

Water spray fixed systems to fire protection service require regularly scheduled care and maintenance by trained personnel.

In addition to inspecting nozzles for proper spray performance during water flow trip tests of the system, it is recommended that nozzles be periodically inspected for broken or missing parts, loading/obstructions, or other evidence of impaired protection. The inspections should be scheduled weekly or as frequently as may be necessary, and corrective action must be taken to ensure that the nozzles will perform as intended in the event of a fire.

The owner is responsible for the inspection, testing, and maintenance of their fire protection system and devices in compliance with this document, as well as with the applicable standards of the NATIONAL FIRE PROTECTION ASSOCIATION (for example, NFPA 25), in addition to the standards of any authorities having jurisdiction. Contact the installing contractor or product manufacturer with any questions.

Water spray fixed systems are recommended to be inspected, tested, and maintained by a qualified Inspection Service in accordance with local requirements and/or national codes.

Limited Warranty

For warranty terms and conditions, visit www.tyco-fire.com.

Ordering Procedure

Contact your local distributor for availability. When placing an order, indicate the full product name and part number (P/N).

Type MV Nozzles

Specify: Type MV Directional Spray Nozzle, Open, Medium Velocity, orifice size (specify), material (specify), spray angle (specify degrees), P/N (specify from Table E).
